

Hand Washing Stations

Where particular situations and/or health department regulations require a portable hand wash station, the following requirements apply:

- Ample supply of soap and potable water
- A separate bucket, cooler, or container with a turn-spout that allows the water to run over your hands to rinse the soap away
- A catch bucket placed below the water container to catch the waste water
- Ample supply of paper towels (no cloth towels)

The amount of water the bucket holds will depend on the number of farmers using the hand washing station and the number of times it may be anticipated that the station will be used. Obviously one gallon of water is not going to go very far. Larger quantities must be provided.

A simple handwash station is pictured below. **The liquid soap dispenser is not in the picture.**
